Kamloops Forklift License

Kamloops Forklift License - Acquiring a forklift license or forklift certification in North America would require the trainee to perform classroom instruction in addition to hands-on training. The state, provincial and federal regulatory bodies are responsible for the training, licensing and certification for powered industrial truck operators. Operators can obtain a license either by a third party or through training administered by the employer. In any case, regulatory requirements must be met. Recertification is needed every two to three years.

The forklift is a powered industrial machine which is designed together with different alternatives, such as stand-up and sit down models, electric and propane versions, and various types and sizes to meet the industrial requirements of employees. Operator training courses are usually individualized in order to deal with the specific types and uses for which the operator is training. Training on a sit-down, gas-powered forklift in a warehouse setting will not be the same as training on a propane-powered, stand-up lift truck in a shipyard. The various lift trucks and their applications makes it impossible to establish universal licensing requirements for all machinery and industries. Regulatory standards, therefore, tend not to focus on specific course requirements but rather on the results of individual training courses.

Employer-provided, on-the-job training is the most common way for operators to receive their forklift certification or license. This particular method of certification requires the employer to provide practical training and classroom sessions on equipment in the workplace. Employers can choose to train workers on every type of forklift separately, or to train them on all machinery combined. The curriculum incorporates lift truck operation methods, company policies, lift truck maintenance and safety measures. Topics particular to the worksite, like dangerous materials or conditions, should be included. Following classroom learning, operators are taught how to safely utilize and operate each and every kind of lift truck on the worksite.

When using a third party trainer, the certification process will normally consist of an on-site component together with hands-on practice.

It should be noted that certifications provided by an employer do not transfer from one employer to the next. Obtaining a lift truck license through employer-provided training allows the operator to operate a lift truck for that employer only.

Forklift safety will always be an important factor of the lift truck license training, even if the particulars of the safety training would be dependent upon the machines being used. Certain safety issues would vary for each industry and employer. Both third-party providers and employer-provided training may have to deal with additional requirements for safety training in applicable industries, like in offshore and marine uses.
